FAUNISTIC RECORDS FROM THE CZECH REPUBLIC – 482

Coleoptera: Curculionidae: Scolytinae

Orthotomicus longicollis (Gyllenhal, 1827). Bohemia bor., Velké Ralsko, 7 km E of Mimoň (5354), 50°39′48.532″N 14°49′3.889″E, 6.vii.2019, 1 ♂, caught in a pheromone trap with pheromone-kairomone Gallopro Pinowit® (WITASEK Pflanzenschutz GmbH, Feldkirchen in Kärnten, Austria), in *Pinus sylvestris* L. stand, R. Kopáč lgt., M. Knížek det. et coll.

Species widely distributed throughout most of Europe, and in Asia, in Syria and Turkey (Knížek 2011). Collected in the Czech Republic (Moravia) for the first time in 1991 (Knížek 1996), and in Bohemia in 2016, in Sobotka, 50°30′15.600′N 15°7′38.400″E, 27.ix.2016, 1 ♂, K. Hradil lgt., J. Foit det. et coll. (Holuša et al. 2019). The first specimen for Bohemia was also caught in a pheromone trap with the same bait as the new record, and was also represented by a single specimen. The actual origin of the specimen was slightly doubtful, due to the pheromone traps having previously been used at other locations. Polyphagous species in different pine species (*P. sylvestris* L., *P. nigra balcanica* (Beissn.) Fitsch., *P. nigra laricio* (Poiret) Maire, *P. nigra pallasiana* (Lamb.) Holmb.) (Pfeffer 1995). In the Czech Republic, known only from *P. sylvestris*. In Moravia it has recently become relatively widely distributed in the south-east, at elevations 200–400 m a. s. l., frequently accompanying *Ips sexdentatus* (Boerner, 1766) in declining pine stands (M. Knížek, unpubl. data). The new record clearly confirms the occurrence of the species in Bohemia.

ACKNOWLEDGMENTS. The study was supported by the Ministry of Agriculture of the Czech Republic, institutional support MZE-RO0118 and project NAZV QK1920406.
